Crafting Secure Digital Experiences

Ethical Hacking Internship

Week 4 - Mini Assessment and Reporting

Class Focus:

- Turn technical work into a clean, professional, instructor-reviewable report.

Topics Covered:

- Writing a proper finding
- Evidence handling
- Severity and impact language
- Remediation writing
- Report structure
- Scope and professionalism

Weekly Task:

Each intern is required to independently select and work on a **different vulnerability domain**. No two interns should cover the same area. The vulnerability can belong to one of the following categories:

- Cloud security
- Web application security
- Network security

Every intern must prepare an **individual VAPT report** based on their chosen vulnerability.

The report must begin with an **Executive Summary**, proceed through all standard VAPT phases, and conclude with a clear **Conclusion**. The content should follow a logical flow, demonstrating a solid understanding of vulnerability identification, analysis, exploitation (where applicable), and remediation.

All findings must be supported with proper **evidence**. Screenshots should be included under the relevant sections in a **structured and organized manner**, with clear labels, captions, and brief descriptions explaining what each screenshot demonstrates. Ensure that evidence directly supports the identified vulnerability and its impact.

The work must be **original, well-documented, and practical** wherever possible.
